		34			-3			$\frac{1+\sqrt{5}}{2}$			1
		15			$12\sqrt{3}$			10			$\frac{3-\sqrt{5}}{2}$

Individual Event 1

I1.1 If $|x + \sqrt{5}| + |y - \sqrt{5}| + |z| = 0$, determine $\alpha = x^2 + y^2 + z^2$.

Reference: 2005 FI4.1, 2006 FI4.2, 2009 FG1.4, 2013 FI1.4, 2015 HG4, 2015 FI1.1

Sum of non-negative terms = 0 \Rightarrow each term = 0 at the same time

$$x + \sqrt{5} = 0 \text{ and } y - \sqrt{5} = 0 \text{ and } z = 0$$

$$x = -\sqrt{5} \text{ and } y = \sqrt{5} \text{ and } z = 0$$

$$\alpha = x^2 + y^2 + z^2 = 5 + 5 + 0 = 10$$

I1.2 If β is the sum of all digits of the product $\underbrace{11111 \dots 11}_{\alpha \text{ 1's}} \times \underbrace{99999 \dots 99}_{\alpha \text{ 9's}}$, determine the value of β .

Reference: 2000 FI4.4

Observe the patterns $11 \times 99 = 1089$; $111 \times 999 = 110889$.

$$\text{Deductively, } \underbrace{11111 \dots 11}_{10 \text{ 1's}} \times \underbrace{99999 \dots 99}_{10 \text{ 9's}} = \underbrace{11111 \dots 1}_{9 \text{ 1's}} \underbrace{1088888 \dots 889}_{9 \text{ 9's}}$$

$$\beta = \text{the sum of all digits} = 9 + 9 \times 8 + 9 = 90$$

I1.3 Suppose that the real function $f(x)$ satisfies $f(xy) = f(x)f(y)$ for all real numbers x and y , and $f(1) < 1$. Determine the value of $\gamma = f(\beta) + 100 - \beta$.

Reference: 2013 FI4.1

$$f(1) = f(1)f(1)$$

$$\Rightarrow f(1)[f(1) - 1] = 0$$

$$\Rightarrow f(1) = 0 \text{ or } 1 \text{ (rejected)}$$

$$\therefore f(1) = 0$$

$$f(x) = f(1 \times x) = f(1)f(x) = 0 \text{ for all real values of } x.$$

$$\gamma = f(\beta) + 100 - \beta = 0 + 100 - 90 = 10$$

I1.4 If n is a positive integer and $f(n) = 2^n + 2^{n-1} + 2^{n-2} + \dots + 2^2 + 2^1 + 1$, determine the value of $\delta = f(\gamma)$.

Reference: 2009 FI1.3, 2017 FI3.4

$$f(n) = 2^{n+1} - 1 \text{ (sum to } n \text{ terms of a G.S. } a = 1, r = 2, \text{ no. of terms} = n + 1)$$

$$\delta = f(10) = 2^{11} - 1 = 2047$$

Individual Event 2

I2.1 If x_0, y_0, z_0 is a solution to the simultaneous equations below,
$$\begin{cases} x - y - z = -1 \\ y - x - z = -2 \\ z - x - y = -4 \end{cases}$$

determine the value of $\alpha = x_0 + y_0 + z_0$.

$$(1) + (2) + (3): -(x + y + z) = -7$$

$$\alpha = 7$$

I2.2 If β is the remainder of $\underbrace{111\cdots111}_{100 \text{ 1's}} \div \alpha$, determine the value of β .

$$111111 \div 7 = 15873$$

$$\underbrace{111\cdots111}_{100 \text{ 1's}} = \underbrace{111\cdots11}_{96 \text{ 1's}}10000 + 1111$$

$$= 7m + 7 \times 158 + 5, \text{ where } m \text{ is an integer}$$

$$\beta = 5$$

I2.3 If γ is the remainder of $[(\beta - 2)^{100} + \beta^{50} + (\beta + 2)^{25}] \div 3$, determine the value of γ .

$$3^{100} + 5^{50} + 7^{25} = 3^{100} + (6 - 1)^{50} + (6 + 1)^{25}$$

$$= 3^{100} + 6^n + 1 + 6^m + 1, \text{ where } m \text{ and } n \text{ are integers}$$

$$\gamma = 2$$

I2.4 If the equation $x^4 + ax^2 + bx + \delta = 0$ has four real roots with three of them being 1, γ and γ^2 , determine the value of δ .

Reference: 2013 FI4.3

Let the fourth root be t .

$$1 + 2 + 2^2 + t = \text{sum of roots} = -\frac{\text{coefficient of } x^3}{\text{coefficient of } x^4} = 0$$

$$t = -7$$

$$1 \times 2 \times 2^2 \times (-7) = \text{product of roots} = \frac{\text{constant term}}{\text{coefficient of } x^4} = \delta$$

$$\delta = -56$$

Individual Event 3

- I3.1** Of the positive integers from 1 to 1000, including 1 and 1000, there are α of them that are not divisible by 5 or 7. Determine the value of α .

Reference: 1993 FG8.3-4, 1994 FG8.1-2, 1998 HI6

Numbers divisible by 5: 5, 10, 15, \dots , 1000, there are 200 numbers

Numbers divisible by 7: 7, 14, 21, \dots , 994, there are 142 numbers

Numbers divisible by 35: 35, 70, \dots , 980, there are 28 numbers

Numbers divisible by 5 or 7 = $200 + 142 - 28 = 314$

Numbers that are not divisible by 5 or 7 = $1000 - 314 = 686$

Remark: The original question is:

Of the positive integers from 1 to 1000, including 1 and 1000, there are α of them that are not divisible by 5 or not divisible by 7. Determine the value of α .

- I3.2** Determine the value of $\beta = 1^2 - 2^2 + 3^2 - 4^2 + \dots + (-1)^\alpha (\alpha + 1)^2$.

Reference: 1997 HI5, 2002 FG2.3, 2004 HI1, 2015 FG4.1

$$\begin{aligned}
 & 1^2 - 2^2 + 3^2 - 4^2 + \dots + 685^2 - 686^2 + 687^2 \\
 &= 1 + (3^2 - 2^2) + (5^2 - 4^2) + \dots + (687^2 - 686^2) \\
 &= 1 + (3 + 2)(3 - 2) + (5 + 4)(5 - 4) + \dots + (687 + 686)(687 - 686) \\
 &= 1 + 5 + 9 + \dots + 1373 \text{ (sum of 344 terms of an A.S., } a = 1, d = 4\text{)} \\
 &= \frac{1 + 1373}{2} \times 344 \\
 &= 236328
 \end{aligned}$$

- I3.3** If γ is the remainder of β divided by the 1993rd term of the following sequence:

1, 2, 2, 3, 3, 3, 4, 4, 4, 4, 5, 5, 5, 5, 5, \dots . Determine the value of γ .

$$1 + 2 + 3 + \dots + 62 = \frac{1 + 62}{2} \times 62 = 1953 \text{ and } 1993 - 1953 = 40 < 63$$

The 1993rd term of the sequence is 63.

$236328 \div 63$, by division, the remainder is 15.

Remark: The original question is:

Determine the remainder of β divided by the 1993rd term of the following sequence:

1, 2, 2, 3, 3, 3, 4, 4, 4, 4, 5, 5, 5, 5, 5, \dots . γ is not mentioned.

I3.4 In the figure below, $BE = AC$, $BD = \frac{1}{2}$ and $DE + BC = 1$.

If δ is γ times the length of ED , determine the value of δ .

Let $DE = x$, $BE = y$

Then $AC = y$, $BC = 1 - x$

It is easy to show that $\triangle BED \sim \triangle BCA$ (equiangular)

$$\frac{DE}{BE} = \frac{AC}{BC} \quad (\text{cor. sides, } \sim \Delta \text{'s}) \Rightarrow \frac{x}{y} = \frac{y}{1-x} \Rightarrow y^2 = x(1-x)$$

$$BE^2 + DE^2 = BD^2 \quad (\text{Pythagoras' theorem})$$

$$y^2 + x^2 = \frac{1}{4} \Rightarrow x(1-x) + x^2 = \frac{1}{4} \Rightarrow x = \frac{1}{4}$$

$$\delta = \frac{15}{4}$$

Individual Event 4

I4.1 Let α be the remainder of 2^{1000} divided by 13, determine the value of α .

Reference: 1972 American High School Mathematics Examination Q31, 2011 HI1

$$13 \times 5 = 64 + 1 \Rightarrow 2^6 = 13 \times 5 - 1$$

$$2^{1000} = 2^4 \cdot 2^{996} = 16 \cdot (2^6)^{166} = (13 + 3) \cdot (13 \times 5 - 1)^{166}$$

$$= (13 + 3) \cdot (13m + 1), \text{ by using binomial theorem}$$

$$= 13n + 3, \text{ where } n \text{ and } m \text{ are integers}$$

$$\alpha = 3$$

I4.2 Determine the value of $\beta = \frac{(7 + 4\sqrt{\alpha})^{\frac{1}{2}} - (7 - 4\sqrt{\alpha})^{\frac{1}{2}}}{\sqrt{\alpha}}$.

Reference: 2013 FI3.1

$$\sqrt{7 + 4\sqrt{3}} = \sqrt{7 + 2\sqrt{12}} = \sqrt{4 + 3 + 2\sqrt{4 \times 3}} = \sqrt{4} + \sqrt{3} = 2 + \sqrt{3}$$

$$\sqrt{7 - 4\sqrt{3}} = 2 - \sqrt{3}$$

$$\beta = \frac{(7 + 4\sqrt{3})^{\frac{1}{2}} - (7 - 4\sqrt{3})^{\frac{1}{2}}}{\sqrt{3}} = \frac{2 + \sqrt{3} - 2 + \sqrt{3}}{\sqrt{3}} = 2$$

I4.3 If $f(a) = a - \beta$ and $F(a, b) = b^2 + a$, determine the value of $\gamma = F(3, f(4))$.

Reference: 1985 FI3.3, 1990 HI3, 2013 FI3.2

$$f(4) = 4 - 2 = 2$$

$$\gamma = F(3, f(4)) = F(3, 2) = 2^2 + 3 = 7$$

I4.4 If δ is the product of all real roots of $x^{\log_7 x} = 10$, determine the value of δ .

$$x^{\log_7 x} = 10$$

$$\log_7 x \log x = \log 10$$

$$\frac{(\log x)^2}{\log 7} = 1$$

$$\log x = \pm \sqrt{\log 7}$$

$$x = 10^{\sqrt{\log 7}} \text{ or } 10^{-\sqrt{\log 7}}$$

$$\text{Product of roots} = 10^{\sqrt{\log 7}} \times 10^{-\sqrt{\log 7}} = 1$$

Group Event 1

G1.1 Simplify $\left(\frac{1 \times 3 \times 9 + 2 \times 6 \times 18 + \dots + n \times 3n \times 9n}{1 \times 5 \times 25 + 2 \times 10 \times 50 + \dots + n \times 5n \times 25n} \right)^{\frac{1}{3}}$.

Reference: 2000 FI5.1

$$\begin{aligned} & \left(\frac{1 \times 3 \times 9 + 2 \times 6 \times 18 + \dots + n \times 3n \times 9n}{1 \times 5 \times 25 + 2 \times 10 \times 50 + \dots + n \times 5n \times 25n} \right)^{\frac{1}{3}} \\ &= \left[\frac{3^3(1^3 + 2^3 + \dots + n^3)}{5^3(1^3 + 2^3 + \dots + n^3)} \right]^{\frac{1}{3}} \\ &= \frac{3}{5} \end{aligned}$$

G1.2 Among 50 school teams joining the HKMO, no team answered all four questions correctly in the paper of a group event. If the first question was solved by 45 teams, the second by 40 teams, the third by 35 teams and the fourth by 30 teams. How many teams solved both the third and the fourth questions?

\therefore No team answered all four questions correctly

\therefore Each team can solve at most three questions.

The maximum number of solved questions = $50 \times 3 = 150$

The actual number of solved questions = $45 + 40 + 35 + 30 = 150$

\therefore Each team can solve exactly three questions.

Number of teams that cannot solve the first question = $(50 - 45)$ teams = 5 teams

\Rightarrow These 5 teams can solve Q2, Q3 and Q4 but not Q1.

Number of teams that cannot solve the second question = $(50 - 40)$ teams = 10 teams

\Rightarrow These 10 teams can solve Q1, Q3 and Q4 but not Q2.

Number of teams that cannot solve the third question = $(50 - 35)$ teams = 15 teams

\Rightarrow These 15 teams can solve Q1, Q2 and Q4 but not Q3.

Number of teams that cannot solve the fourth question = $(50 - 30)$ teams = 20 teams

\Rightarrow These 20 teams can solve Q1, Q2 and Q3 but not Q4.

Number of school teams solved both the third and the fourth questions = $5 + 10 = 15$

Remark We cannot use the Venn diagram on the right with explanation below:

x = school teams that can solve Q1 but not Q2, Q3 nor Q4.

y = school teams that can solve Q1, Q2 but not Q3 nor Q4.

z = school teams that can solve all four questions.

t = school teams that can solve Q1, Q3 and Q4 but not Q2

However, we could not find any part in Venn diagram representing school teams that can solve Q1, Q4 but not Q2 nor Q3 !!!

G1.3 Let n be the product 3659893456789325678 and 342973489379256. Determine the number of digits of n . (**Reference: 2013 FG4.1**)

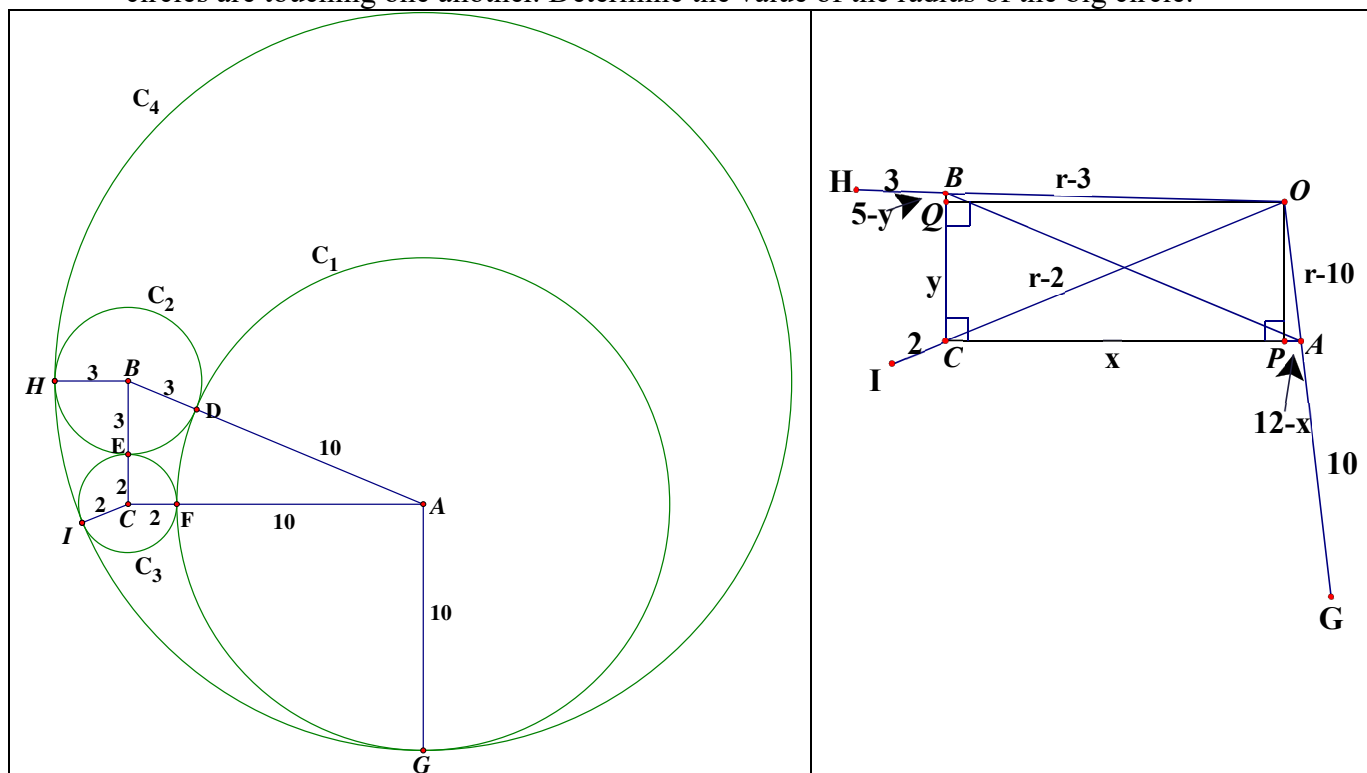

Let $x = 3\,659\,893\,456\,789\,325\,678$, $y = 342\,973\,489\,379\,256$

$x = 3.7 \times 10^{18}$, $y = 3.4 \times 10^{14}$ (correct to 2 sig. fig.)

$n = xy = 3.7 \times 10^{18} \times 3.4 \times 10^{14} = 12.58 \times 10^{32} = 1.258 \times 10^{33}$

The number of digits of n is 34.

G1.4 Three circles of radii 2, 3 and 10 units are placed inside another big circle in such a way that all circles are touching one another. Determine the value of the radius of the big circle.

Let A be the centre of circle C_1 with radius 10, B be the centre of circle C_2 with radius 3, C be the centre of circle C_3 with radius 2. Join AB, BC, AC .

Suppose C_1 and C_2 touch each other at D , C_2 and C_3 touch each other at E , C_3 and C_1 touch each other at F . Then A, D, B are collinear, B, E, C are collinear, C, F, A are collinear.

$$AB = 10 + 3 = 13, BC = 3 + 2 = 5, AC = 10 + 2 = 12$$

$$BC^2 + AC^2 = 5^2 + 12^2 = 25 + 144 = 169 = 13^2 = AB^2$$

$\therefore \angle ACB = 90^\circ$ (converse, Pythagoras' theorem)

Let O be the centre of circle C_4 with radius r circumscribing all three circles C_1, C_2, C_3 at G, H and I respectively. Then O, A, G are collinear, O, B, H are collinear, O, C, I are collinear.

$$AG = 10, BH = 3, CI = 2, OA = r - 10, OB = r - 3, OC = r - 2.$$

Let P and Q be the feet of perpendiculars drawn from O onto AC and AB respectively.

Then $OPCQ$ is a rectangle.

Let $CP = x = QO$ (opp. sides of rectangle), $CQ = y = PO$ (opp. sides of rectangle)

$$AP = 12 - x, BQ = 5 - y.$$

$$\text{In } \triangle OCP, x^2 + y^2 = (r - 2)^2 \dots\dots (1) \text{ (Pythagoras' theorem)}$$

$$\text{In } \triangle OAP, (12 - x)^2 + y^2 = (r - 10)^2 \dots\dots (2) \text{ (Pythagoras' theorem)}$$

$$\text{In } \triangle OBQ, x^2 + (5 - y)^2 = (r - 3)^2 \dots\dots (3) \text{ (Pythagoras' theorem)}$$

$$(1) - (2): 24x - 144 = 16r - 96 \Rightarrow x = \frac{2r + 6}{3} \dots\dots (4)$$

$$(1) - (3): 10y - 25 = 2r - 5 \Rightarrow y = \frac{r + 10}{5} \dots\dots (5)$$

$$\text{Sub. (4) and (5) into (1): } \left(\frac{2r + 6}{3}\right)^2 + \left(\frac{r + 10}{5}\right)^2 = (r - 2)^2$$

$$25(4r^2 + 24r + 36) + 9(r^2 + 20r + 100) = 225(r^2 - 4r + 4)$$

$$116r^2 - 1680r - 900 = 0 \Rightarrow 29r^2 - 420r - 225 = 0$$

$$(r - 15)(29r + 15) = 0 \Rightarrow r = 15, \text{ the radius of the big circle is 15.}$$

Group Event 2

G2.1 On a 3×3 grid of 9 squares, each square is to be painted with either Red or Blue. If α is the total number of possible colouring in which no 2×2 grid consists of only Red squares, determine the value of α .

If there is no restriction, number of possible colouring = $2^9 = 512$

(1) If all 9 squares are painted as red, number of colouring = 1

(2) If there are exactly three 2×2 grid consists of only Red squares, possible pattern may be:

R	R	B
R	R	R
R	R	R

90° rotation gives another possible pattern

Number of colouring = 4

(3) If there are exactly two 2×2 grid consists of only Red squares, possible pattern may be:

B	R	R
R	R	R

R	B	R
R	R	B
R	R	R

R	B	R
R	R	R
R	R	B

90° rotation gives another possible pattern
Number of colouring = $4 \times 3 = 12$

\therefore Total number of possible colouring in which no 2×2 grid consists of only Red squares
= No restriction – all 9 red squares – exactly 3 2×2 red grid – exactly 2 2×2 red grid – exactly 1 2×2 red grid
= $512 - 1 - 4 - 2 - 20 - 4 - 20 - 20 - 12 - 12 = 417$

Method 2 (a) All 9 blue squares = 1 pattern. (b) 8 blue squares + 1 red squares = 9 patterns.

(c) $7B+2R = C_2^9 = 36$ patterns, (d) $6B+3R = C_3^9 = 84$ patterns, (e) $5B+4R = C_4^9 - 4 = 122$ patterns

(f) $4B+5R = C_5^9 - 4 \times 5 = 106$ patterns, (g) $3B+6R = C_6^9 - 4 \times C_2^5 + 4 = 48$ patterns

(h) $2B+7R = 8 + 2 = 10$ patterns, (i) $1B+8R = 1$ pattern

Total number of different patterns = $1 + 9 + 36 + 84 + 122 + 106 + 48 + 10 + 1 = 417$

- G2.2** If the sum of 25 consecutive positive integers is the product of 3 prime numbers, what is the minimum sum of these 3 prime numbers?

Let the smallest positive integer be x . We use the formula: $S(n) = \frac{n}{2}[2a + (n-1)d]$.

$$\frac{25}{2}(2x + 24 \times 1) = 25(x + 12) = 5 \times 5 \times (x + 12) = \text{product of 3 prime numbers}$$

The minimum prime for $x + 12$ is 13. The minimum sum of these 3 prime numbers is 23.

- G2.3** Determine the sum of all real roots of the following equation $|x + 3| - |x - 1| = x + 1$.

When $x \leq -3$, the equation becomes $-x - 3 - (1 - x) = x + 1 \Rightarrow x = -5$

When $-3 < x \leq 1$, the equation becomes $x + 3 - (1 - x) = x + 1 \Rightarrow x = -1$

When $1 < x$, the equation becomes $x + 3 - (x - 1) = x + 1 \Rightarrow x = 3$

\therefore Sum of all real roots $= -5 + (-1) + 3 = -3$

A graph is given below:

- G2.4** In the figure below, there are 4 identical circles placed inside an equilateral triangle. If the radii of the circles are 1 unit, what is the value of the area of the triangle?

Let the triangle be ABC , O is the centre of the middle circle, D, E, F are the centres of the other 3 circles respectively.

Let P, Q, R, S, T, U be the points of contact as shown.

$DP \perp AB, EQ \perp AB, ER \perp BC, FS \perp BC, FT \perp AC,$

$DU \perp AC$ (tangent \perp radius)

$$DP = EQ = ER = FS = FT = DU = 1 \text{ (radii)}$$

$$OD = OE = OF = 2 \text{ (radii 1 + radii 1)}$$

$$\triangle ODE \cong \triangle OEF \cong \triangle OFD \text{ (S.S.S.)}$$

$$\angle DOE = \angle EOF = \angle FOD \text{ (corr. } \angle s \cong \Delta s)$$

$$\angle DOE + \angle EOF + \angle FOD = 360^\circ \text{ (}\angle s \text{ at a point)}$$

$$\therefore \angle DOE = \angle EOF = \angle FOD = 120^\circ$$

$$DPQE, ERSF, FTUD \text{ are rectangles (opp. sides are eq. and //)}$$

$$DE = EF = FD = 2 \times 2 \sin 60^\circ = 2\sqrt{3} = PQ = RS = TU$$

$$\text{In } \triangle ADU, \angle DAU = 30^\circ, DU = 1, DU \perp AU,$$

$$AU = 1 \tan 60^\circ = \sqrt{3}$$

$$\therefore AB = BC = CA = 2\sqrt{3} + 2\sqrt{3} = 4\sqrt{3}$$

$$\text{Area of } \triangle ABC = \frac{1}{2} \cdot (4\sqrt{3})^2 \sin 60^\circ = 12\sqrt{3}$$

Group Event 3**G3.1** Simplify $\sqrt{3+\sqrt{5}} + \sqrt{3-\sqrt{5}}$.**Reference: 1993 FI1.4, 1999 HG3, 2001 FG2.1, 2011 HI7, 2015 FI4.2**

$$\sqrt{3+\sqrt{5}} = \sqrt{\frac{6+2\sqrt{5}}{2}} = \frac{1}{\sqrt{2}} \cdot \sqrt{5+2\sqrt{5}+1} = \frac{1}{\sqrt{2}} \cdot (\sqrt{5}+1)$$

$$\sqrt{3-\sqrt{5}} = \sqrt{\frac{6-2\sqrt{5}}{2}} = \frac{1}{\sqrt{2}} \cdot \sqrt{5-2\sqrt{5}+1} = \frac{1}{\sqrt{2}} \cdot (\sqrt{5}-1)$$

$$\sqrt{3+\sqrt{5}} + \sqrt{3-\sqrt{5}} = \frac{1}{\sqrt{2}} \cdot (\sqrt{5}+1) + \frac{1}{\sqrt{2}} \cdot (\sqrt{5}-1) = \frac{1}{\sqrt{2}} \cdot (2\sqrt{5}) = \sqrt{10}$$

G3.2 Let p be a prime and m be an integer. If $p(p+m) + 2p = (m+2)^3$, find the greatest possible value of m .

$$p(p+m+2) = (m+2)^3$$

If m is even and p is odd, then $\text{odd} \times (\text{odd} + \text{even} + 2) = (\text{even} + 2)^3 \Rightarrow \text{LHS} \neq \text{RHS} !!!$ If m is odd and p is odd, then $\text{odd} \times (\text{odd} + \text{odd} + 2) = (\text{odd} + 2)^3 \Rightarrow \text{LHS} \neq \text{RHS} !!!$ In all cases, p must be even. \therefore the only even prime is 2 $\therefore p = 2$

$$2(m+4) = (m+2)^3$$

LHS is even $\Rightarrow (m+2)^3$ is even $\Rightarrow m+2$ is even \Rightarrow RHS is divisible by 8 \Rightarrow LHS is divisible by 8 $\Rightarrow m+4 = 4n$, where n is an integer $\Rightarrow m+2 = 4n-2$ Put $m+2 = 4n-2$ into the equation: $2(4n) = (4n-2)^3$

$$n = (2n-1)^3$$

 $\Rightarrow n = 1, m = 0$ (This is the only solution, $n < (2n-1)^3$ for $n > 1$ and $n > (2n-1)^3$ for $n < 1$)**G3.3** Determine a root to $x = \left(x - \frac{1}{x}\right)^{\frac{1}{2}} + \left(1 - \frac{1}{x}\right)^{\frac{1}{2}}$.

$$x - \sqrt{1 - \frac{1}{x}} = \sqrt{x - \frac{1}{x}} \Rightarrow \left(x - \sqrt{1 - \frac{1}{x}}\right)^2 = \left(\sqrt{x - \frac{1}{x}}\right)^2$$

$$x^2 - 2x\sqrt{1 - \frac{1}{x}} + 1 - \frac{1}{x} = x - \frac{1}{x}$$

$$x^2 - x + 1 = 2\sqrt{x^2 - x} \Rightarrow (x^2 - x) - 2\sqrt{x^2 - x} + 1 = 0$$

$$\left(\sqrt{x^2 - x} - 1\right)^2 = 0$$

$$\sqrt{x^2 - x} = 1 \Rightarrow x^2 - x - 1 = 0$$

$$x = \frac{1+\sqrt{5}}{2} \quad \text{or} \quad \frac{1-\sqrt{5}}{2} \quad (\text{rejected as } x > 0)$$

G3.4 In the figure below, the area of each small triangle is 1.Determine the value of the area of the triangle ABC .

Total number of equilateral triangles = 24

Area of ABC

$$= 24 - \frac{1}{2} \cdot 4 - \frac{1}{2} \cdot 6 - 1 - \frac{1}{2} \cdot 4 - 6$$

$$= 10$$

Group Event 4**G4.1** Let $b = 1^2 - 2^2 + 3^2 - 4^2 + 5^2 - \dots - 2012^2 + 2013^2$.Determine the remainder of b divided by 2015.**Reference: 1997 HI5, 2002 FG2.3, 2004 HI1, 2015 FI3.2**

$$b = 1 + (3 - 2)(3 + 2) + (5 - 4)(5 + 4) + \dots + (2013 - 2012)(2012 + 2013)$$

$$b = 1 + 5 + 9 + \dots + 4025$$

This is an arithmetic series with $a = 1$, $d = 4$.

$$1 + (n - 1) \times 4 = 4025$$

$$\Rightarrow n = 1007$$

$$b = \frac{1007}{2}(1 + 4025)$$

$$= 1007 \times 2013$$

$$= 1007 \times (2015 - 2)$$

$$= 1007 \times 2015 - 2014$$

$$= 1006 \times 2015 + 1$$

Remainder = 1

G4.2 There are positive integers with leading digits being 6 and upon removing this leading digit, the resulting integer is $\frac{1}{25}$ of the original value. Determine the least of such positive integers.Let the original number be x .

$$x = 6 \times 10^n + y, \text{ where } y < 10^n \text{ and } y = \frac{1}{25}x$$

$$x = 6 \times 10^n + \frac{1}{25}x$$

$$24x = 150 \times 10^n$$

$$4x = 25 \times 10^n$$

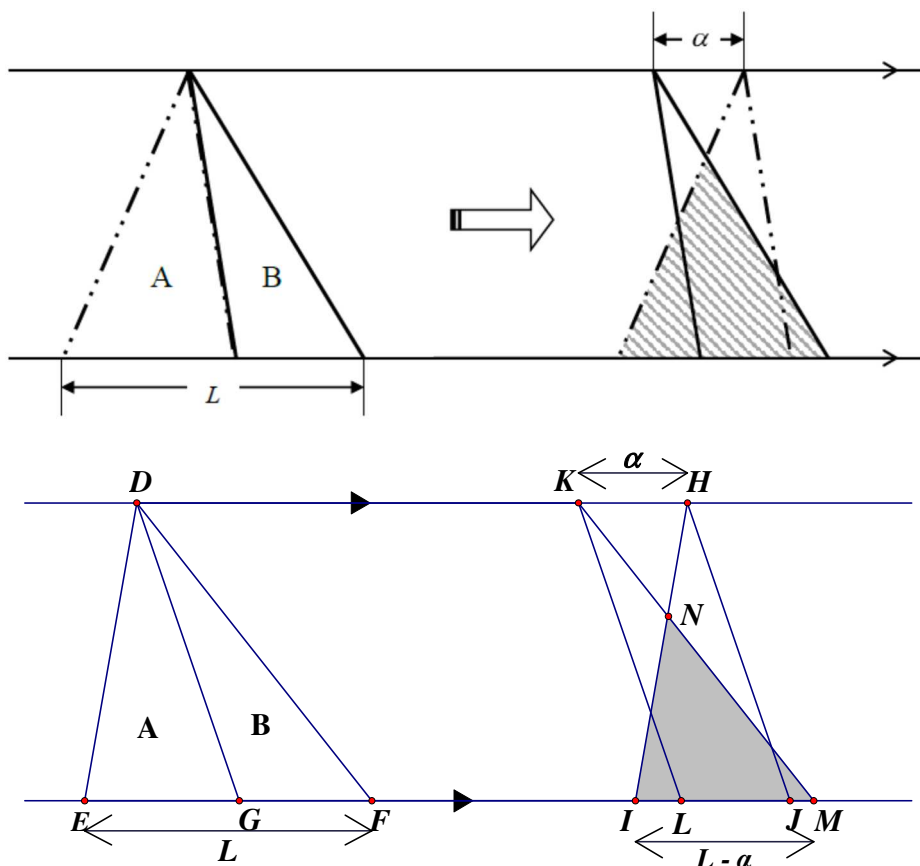

4 is not a factor of 25, so 4 must be a factor of 10^n Least possible $n = 2$ The least positive x is $25 \times 10^2 \div 4 = 625$ **G4.3** If $x + \frac{1}{x} = 1$, determine the value of $x^5 + \frac{1}{x^5}$.

$$\left(x + \frac{1}{x}\right)^2 = 1 \Rightarrow x^2 + 2 + \frac{1}{x^2} = 1 \Rightarrow x^2 + \frac{1}{x^2} = -1$$

$$\left(x + \frac{1}{x}\right)\left(x^2 + \frac{1}{x^2}\right) = 1 \times (-1) = -1 \Rightarrow x^3 + \frac{1}{x^3} + x + \frac{1}{x} = -1 \Rightarrow x^3 + \frac{1}{x^3} = -2$$

$$\left(x^2 + \frac{1}{x^2}\right)\left(x^3 + \frac{1}{x^3}\right) = (-1) \times (-2) = 2 \Rightarrow x^5 + \frac{1}{x^5} + x + \frac{1}{x} = 2 \Rightarrow x^5 + \frac{1}{x^5} = 1$$

G4.4 In the figure below, when triangle A shifts α units to the right, the area of shaded region is $\frac{\alpha}{L}$ times of the total area of the triangles A and B . Determine the value of $\frac{\alpha}{L}$.

Let the original triangle be DEF . G is a point on EF with $EF = L$.

$\triangle DEG$ is translated to $\triangle HIJ$ by α units, $\triangle DEG \cong \triangle HIJ$, $\triangle DGF \cong \triangle KLM$, $EF = L$, $HK = \alpha$.

Let HI intersects KM at N , $IM = L - \alpha$

Consider $\triangle DEF$ in the left figure and $\triangle NIM$ in the right figure.

$\angle DEF = \angle NIM$ (corr. \angle s, $DE \parallel HI$)

$\angle DFE = \angle NMI$ (corr. \angle s, $DF \parallel KM$)

$\therefore \triangle DEF \sim \triangle NIM$ (equiangular)

$\frac{S_{\triangle NIM}}{S_{\triangle DEF}} = \left(\frac{L - \alpha}{L}\right)^2$ (ratio of areas of $\sim \Delta$ s)

$\frac{\alpha}{L} = \left(1 - \frac{\alpha}{L}\right)^2$ (Given $\frac{S_{\triangle NIM}}{S_{\triangle DEF}} = \frac{\alpha}{L}$)

$\left(\frac{\alpha}{L}\right)^2 - 3\left(\frac{\alpha}{L}\right) + 1 = 0$, this is a quadratic equation in $\frac{\alpha}{L}$.

$$\frac{\alpha}{L} = \frac{3 + \sqrt{5}}{2} \text{ or } \frac{3 - \sqrt{5}}{2}$$

From the figure, $\frac{\alpha}{L} < 1$ and $\frac{3 + \sqrt{5}}{2} > 1$

$\therefore \frac{\alpha}{L} = \frac{3 - \sqrt{5}}{2}$ only
