## Reference:

[http://www.td.gov.hk/en/road\\_safety/road\\_users\\_code/index/chapter\\_5\\_for\\_all\\_drivers/stopping\\_distance\\_/index.html](http://www.td.gov.hk/en/road_safety/road_users_code/index/chapter_5_for_all_drivers/stopping_distance_/index.html)

Suppose a driver wants to stop a car while he is driving.

The stopping distance ( $S$  m) is the sum of the thinking distance ( $x$  m) and the braking distance ( $y$  m)

The thinking distance varies as the speed ( $v$  km/h). The braking distance partly varies as  $v$ , partly varies as the square of  $v$  and partly varies as the cube of  $v$ .

## Shortest stopping distance in metres

**40 km/h**      Thinking distance + braking distance = stopping distance  
vehicle speed      10m      10m      20m

**60 km/h**      Thinking distance + braking distance = stopping distance  
vehicle speed      15m      20m      35m

**80 km/h**      Thinking distance + braking distance = stopping distance  
vehicle speed      20m      40m      60m

- (a) Express  $S$  in terms of  $x$  and  $y$ . 10 marks
- (b) Express  $x$  in terms of  $v$ . 10 marks
- (c) Express  $y$  in terms of  $v$ . 30 marks
- (d) Show that  $S = \frac{v^3}{9600} - \frac{v^2}{160} + kv$ . Find  $k$ . 20 marks
- (e) If the speed of the car is 100 km/h, find the stopping distance. 10 marks
- (f) Suppose the car crashed in an accident. If the skid mark was 130 m, what was the least speed just before the crash? 20 marks

$$(a) \quad S = x + y$$

$$(b) \quad x = \frac{1}{4}v$$

$$(c) \quad y = av^3 + bv^2 + cv$$

$$\begin{cases} a(40)^3 + b(40)^2 + c(40) = 10 \\ a(60)^3 + b(60)^2 + c(60) = 20 \\ a(80)^3 + b(80)^2 + c(80) = 40 \end{cases}$$

$$\begin{cases} a(60)^3 + b(60)^2 + c(60) = 20 \\ a(80)^3 + b(80)^2 + c(80) = 40 \end{cases}$$

$$\begin{cases} 6400a + 160b + 4c = 1 \dots\dots(1) \\ 21600a + 360b + 6c = 2 \dots\dots(2) \\ 51200a + 640b + 8c = 4 \dots\dots(3) \end{cases}$$

$$\begin{cases} 6400a + 160b + 4c = 1 \dots\dots(1) \\ 21600a + 360b + 6c = 2 \dots\dots(2) \\ 51200a + 640b + 8c = 4 \dots\dots(3) \end{cases}$$

$$\begin{cases} 6400a + 160b + 4c = 1 \dots\dots(1) \\ 21600a + 360b + 6c = 2 \dots\dots(2) \\ 51200a + 640b + 8c = 4 \dots\dots(3) \end{cases}$$

$$\begin{cases} 6400a + 160b + 4c = 1 \dots\dots(1) \\ 21600a + 360b + 6c = 2 \dots\dots(2) \\ 51200a + 640b + 8c = 4 \dots\dots(3) \end{cases}$$

$$(2) - (1), (3) - (2): \begin{cases} 15200a + 200b + 2c = 1 \dots\dots(4) \\ 29600a + 280b + 2c = 2 \dots\dots(5) \end{cases}$$

$$(5) - (4): 14400a + 80b = 1 \dots\dots\dots(6)$$

$$(3) - 2(1): 38400a + 320b = 2 \dots\dots\dots(7)$$

$$2(6) - (7)/2: 9600a = 1$$

$$a = \frac{1}{9600}$$

$$\text{Sub. } a = \frac{1}{9600} \text{ into (6): } \frac{14400}{9600} + 80b = 1$$

$$80b = -\frac{1}{2}$$

$$b = -\frac{1}{160}$$

$$\text{Sub. } a = \frac{1}{9600}, b = -\frac{1}{160} \text{ into (1)}$$

$$\frac{6400}{9600} - \frac{160}{160} + 4c = 1$$

$$4c = \frac{4}{3}$$

$$c = \frac{1}{3}$$

$$\therefore y = \frac{v^3}{9600} - \frac{v^2}{160} + \frac{v}{3}$$

$$(d) \quad S = \frac{1}{4}v + \frac{v^3}{9600} - \frac{v^2}{160} + \frac{v}{3}$$

$$= \frac{v^3}{9600} - \frac{v^2}{160} + \frac{7v}{12}$$

$$k = \frac{7}{12}$$

$$(e) \quad \text{When } v = 100,$$

$$S = \frac{1000000}{9600} - \frac{10000}{160} + \frac{700}{12}$$

$$S = 100$$

The stopping distance is 100 m.

(f) Skid mark = 130 m  $\rightarrow$  breaking distance =  $y$  m = 130 m

$$\frac{v^3}{9600} - \frac{v^2}{160} + \frac{v}{3} = 130$$

$$v^3 - 60v^2 + 3200v - 1248000 = 0$$

$$\text{Let } f(v) = v^3 - 60v^2 + 3200v - 1248000$$

$$f(120) = 0, v - 120 \text{ is a factor.}$$

$$f(v) = (v - 120)(v^2 + 60v + 10400) = 0$$

$$v = 120$$

The minimum speed was 120 km/h
