Eric was born in 20th century (1901–2000), and he was y years old in the year of y^2 .

Find his year of birth.

Reference: 1990 HG5

Suppose Eric was born in x years after 1900 A.D.

$$1900 + x + y - 1 = y^2$$

$$43^2 = 1849 < 1900, 44^2 = 1936, 45^2 = 2025 > 2000$$

$$\text{If } y = 44, x = 1936 - 1900 - 44 + 1 = -7 \text{ (rejected)}$$

$$\text{If } y = 45, x = 2025 - 1900 - 45 + 1 = 81$$

$$1900 + x = 1981$$

\Rightarrow He was born in A.D. 1981.

- 17** 如圖一所示，一條公切線與一大圓及一小圓分別相交於點 P 及 Q 。已知該兩圓相交於點 C 且它們的半徑分別為 49 及 25，求 PQ 的長。

As shown in Figure 1, a common tangent touches a large circle and a small circle at P and Q respectively. Given that the two circles touch each other at C and their radii are 49 and 25 respectively, find the length of PQ .

圖一 Figure 1

As shown, let the centre of the two circles be A and B respectively. $AP \perp PQ$, $BQ \perp PQ$ (tangent \perp radius)

Draw $BD \perp AP$, cutting AP at D .

Then $DPQB$ is a rectangle.

$AP = 49$, $BQ = 25 = DP$ (opp. sides of rectangle)

$AD = AP - DP = 49 - 25 = 24$; $AB = AC + CB = 49 + 25 = 74$

$$PQ = DB = \sqrt{AB^2 - AD^2} = \sqrt{74^2 - 24^2}$$

$$= \sqrt{(74+24)(74-24)}$$

$$= \sqrt{98 \times 50}$$

$$= \sqrt{49 \times 100} = 70$$

- 18** 如圖二所示， $ABCD$ 是一個四邊形。若 $\angle ABD = \angle CBD = 60^\circ$ ， $\angle ADB = 74^\circ$ 及 $\angle CDB = 53^\circ$ ，求 $\angle BAC$ 的值。

As shown in Figure 2, $ABCD$ is a quadrilateral.

If $\angle ABD = \angle CBD = 60^\circ$, $\angle ADB = 74^\circ$ and $\angle CDB = 53^\circ$, find the value of $\angle BAC$.

Method 1 provided by Mr. Elstan Fong, Mr. Tony Cho and Mr. Ben Yip

In $\triangle ABD$, $\angle BAD = 180^\circ - 60^\circ - 74^\circ = 46^\circ$ (\angle sum of \triangle)

Let $BC = 1$, $\angle BAC = \theta$, $\angle CAD = 46^\circ - \theta$.

$$\text{In } \triangle BCD, \frac{DC}{\sin 60^\circ} = \frac{BC}{\sin 53^\circ} \Rightarrow DC = \frac{\sin 60^\circ}{\sin 53^\circ} \dots\dots (1)$$

$$\text{In } \triangle ACD, \frac{AC}{\sin(74^\circ + 53^\circ)} = \frac{DC}{\sin(46^\circ - \theta)}$$

$$\text{By (1), } AC = \frac{\sin 60^\circ}{\sin 53^\circ} \times \frac{\sin 127^\circ}{\sin(46^\circ - \theta)} = \frac{\sin 60^\circ}{\sin(46^\circ - \theta)} \dots\dots (2)$$

$$\text{In } \triangle ABC, \frac{BC}{\sin \theta} = \frac{AC}{\sin 120^\circ}$$

$$\text{By (2), } \frac{1}{\sin \theta} = \frac{\sin 60^\circ}{\sin(46^\circ - \theta)} \times \frac{1}{\sin 120^\circ}$$

$$\frac{1}{\sin \theta} = \frac{1}{\sin(46^\circ - \theta)}$$

$$\therefore \theta = 46^\circ - \theta$$

$$\angle BAC = \theta = 23^\circ$$

Method 2

Reflect $\triangle BCD$ along DC to $\triangle FCD$.

By the property of reflection,

$$BD = FD, \angle CDF = 53^\circ, \angle CFD = 60^\circ$$

$$\angle ADB + \angle CDB + \angle CDF = 180^\circ$$

$\therefore A, D, F$ are collinear

Extend ADF and BC to meet at E .

$$\angle DBF = \angle DFB = \frac{180^\circ - 53^\circ - 53^\circ}{2} = 37^\circ$$

(base \angle s, isos. \triangle , \angle sum of \triangle)

$$\begin{aligned} \angle CFE &= 180^\circ - \angle CFD = 120^\circ \text{ (adj. } \angle\text{s on st. line)} \\ &= \angle ABC \end{aligned}$$

$\therefore A, B, C, F$ are concyclic (ext. \angle = int. opp. \angle)

$$\begin{aligned} \angle BAC = \theta &= \angle BFC \text{ (} \angle\text{s in the same segment)} \\ &= \angle CFD - \angle DFB = 60^\circ - 37^\circ = 23^\circ \end{aligned}$$

- 19** 設 a 為正實數。若方程組 $\begin{cases} (a+3)x + (a+2)y = 1 \\ (a-1)x - ay = 1 \end{cases}$ 無解，求 a 的值。

Let a be a positive real number.

If the system of equations $\begin{cases} (a+3)x + (a+2)y = 1 \\ (a-1)x - ay = 1 \end{cases}$ has no solution, find the value of a .

$$\begin{vmatrix} a+3 & a+2 \\ a-1 & -a \end{vmatrix} = 0$$

$$-a(a+3) - (a-1)(a+2) = 0$$

$$-a^2 - 3a - a^2 - a + 2 = 0$$

$$2a^2 + 4a - 2 = 0 \Rightarrow a^2 + 2a - 1 = 0$$

$$a = -1 \pm \sqrt{2}$$

$$\because a > 0 \therefore a = -1 + \sqrt{2}$$

- 110** 圖三所示為圓 $ABCDEFGH$ ，求 $a + b + c + d$ 的值。

Figure 3 shows the circle $ABCDEFGH$.

Find the value of $a + b + c + d$.

As shown in the figure, let $a = a_1 + a_2$, $c = c_1 + c_2$

$$a_2 + b = 180^\circ, a_1 + c_2 = 180^\circ, c_1 + d = 180^\circ$$

(opp. \angle s cyclic quad.)

$$a + b + c + d = 180^\circ \times 3 = 540^\circ$$

圖三 Figure 3

If $1 + 2 + 3 + \dots + k$ is a perfect square N , where $N < 250\,000$,

find the largest possible value of N .

Reference: [Discovering the square-triangular numbers](#) by Phil Lafer, Washington State University

The first few square-triangular numbers are 1, 36, 1225 and 41616.

$$T_1 = 1 = 1^2 = 1^2 \times (1+0)^2$$

$$T_2 = 1 + 2 + 3 + 4 + 5 + 6 = 36 = 2^2 \times 3^2 = 2^2 \times (2+1)^2$$

$$T_3 = 1 + 2 + \dots + 49 = \frac{49 \times 50}{2} = 35^2 = 1225 = 5^2 \times 7^2 = 5^2 \times (5+2)^2$$

$$T_4 = 1 + 2 + \dots + 288 = \frac{288 \times 289}{2} = 204^2 = 41616 = 12^2 \times 17^2 = 12^2 \times (12+5)^2$$

Define the recurrence sequence $\{a_n\}$ as follows: $a_0 = 0$, $a_1 = 1$, $a_{n+2} = 2a_{n+1} + a_n$ for $n \geq 0$.

Then $a_2 = 2 \times 1 + 0 = 2$, $a_3 = 2 \times 2 + 1 = 5$, $a_4 = 2 \times 5 + 2 = 12$

It seems that $a_1, a_2, a_3, a_4, \dots, a_n$ are the first square factor of $T_1, T_2, T_3, T_4, \dots, T_n$.

It also seems that the second square factor are $(a_1 + a_0), (a_2 + a_1), \dots, (a_n + a_{n-1})$.

We shall prove this by induction. We have already proved that it is true for $n = 1, 2, 3$ and 4.

$$\text{Suppose } T_k = 1 + 2 + \dots + m = \frac{m \times (m+1)}{2} = \frac{2a_k^2 \times (a_k + a_{k-1})^2}{2} \text{ and } \left| 2a_k^2 - (a_k + a_{k-1})^2 \right| = 1$$

Clearly $a_{k+1}^2 \times (a_{k+1} + a_k)^2$ is a square number.

$$a_{k+1}^2 \times (a_{k+1} + a_k)^2 = \frac{2a_{k+1}^2 \times (a_{k+1} + a_k)^2}{2}$$

$$\begin{aligned} \left| 2a_{k+1}^2 - (a_{k+1} + a_k)^2 \right| &= \left| 2(2a_k + a_{k-1})^2 - (2a_k + a_{k-1} + a_k)^2 \right| \\ &= \left| 2(4a_k^2 + 4a_k a_{k-1} + a_{k-1}^2) - (9a_k^2 + 6a_k a_{k-1} + a_{k-1}^2) \right| \\ &= \left| -a_k^2 + 2a_k a_{k-1} + a_{k-1}^2 \right| = \left| a_k^2 - 2a_k a_{k-1} - a_{k-1}^2 \right| \\ &= \left| 2a_k^2 - (a_k + a_{k-1})^2 \right| = 1 \text{ (by induction assumption)} \end{aligned}$$

By mathematical induction, $a_{k+1}^2 \times (a_{k+1} + a_k)^2$ is a triangular number for all positive integer n .

Claim: Any square-triangular number is given by $T_n = a_n^2 \times (a_n + a_{n-1})^2$.

Proof: Let $m_1^2 = \frac{k_1(k_1+1)}{2}$ be an arbitrary square-triangular number. (m_1, k_1 are +ve integers.)

If k_1 is odd, then $\frac{k_1+1}{2}$ is an integer and k_1 and $\frac{k_1+1}{2}$ are relatively prime ($2 \times \frac{k_1+1}{2} - k_1 = 1$)

\therefore Both k_1 and $\frac{k_1+1}{2}$ are perfect squares

Let $\frac{k_1+1}{2} = b_1^2$ and $k_1 = c_1^2$ with $b_1, c_1 \geq 1$.

Now $b_1^2 = \frac{k_1+1}{2} \Rightarrow k_1 = c_1^2 = 2b_1^2 - 1 \geq 1 \Rightarrow c_1^2 - b_1^2 = b_1^2 - 1 \geq 0 \Rightarrow b_1 \leq c_1$

$b_1 = c_1 \Leftrightarrow k_1 = \frac{k_1+1}{2} \Leftrightarrow k_1 = 1 \Leftrightarrow m_1^2 = 1 \Leftrightarrow m_1^2 = a_1^2 \times (a_1 + a_0)^2 = T_1$ and we are done.

Consider $b_1 < c_1$ and define $b_2 = c_1 - b_1$, $c_2 = 2b_1 - c_1$ and $m_2^2 = b_2^2 \times c_2^2$.

$$\therefore 2b_1^2 - c_1^2 = k_1 + 1 - k_1 = 1$$

We factor and get $(\sqrt{2}b_1 - c_1)(\sqrt{2}b_1 + c_1) = 1$,

where $b_1, c_1 \geq 1$ implies that $\sqrt{2}b_1 + c_1 > 0$, which implies that $\sqrt{2}b_1 - c_1 > 0$.

So $\sqrt{2}b_1 > c_1$. Now $\frac{3}{2} > \sqrt{2}$ so it also follows that $\frac{3}{2}b_1 > c_1$.

This is equivalent to $3b_1 > 2c_1$ and thus $2b_1 - c_1 > c_1 - b_1$.

Also $c_1 > b_1 > 2b_1 - c_1 > c_1 - b_1 > 0$, or equivalently $c_1 > b_1 > c_2 > b_2 > 0$.

Furthermore, $m_2^2 = b_2^2 \times c_2^2 = \frac{2b_2^2 \times c_2^2}{2}$

where $|2b_2^2 - c_2^2| = |2(c_1 - b_1)^2 - (2b_1 - c_1)^2|$

$$= |c_1^2 - 2b_1^2| = |-1|^2 = 1$$

So, m_2^2 is also a square-triangular number and is necessarily smaller than m_1^2 .

It might be observed that in this case $m_2^2 \neq 1$ which is equivalent to the fact that $c_2 > b_2$.

Now let $m_2^2 = \frac{2b_2^2 \times c_2^2}{2} = \frac{k_2(k_2+1)}{2}$ with $2b_2^2 = k_2$ (since $2b_2^2 - c_2^2 = -1$ gives $c_2^2 = 2b_2^2 + 1$.)

Continue in the same manner by defining $b_3 = c_2 - b_2$, $c_3 = 2b_2 - c_2$, and $m_3^2 = b_3^2 \times c_3^2$.

In this case, $b_3 \leq c_3$ since **if** $b_3 > c_3$, then by substitution $c_2 - b_2 > 2b_2 - c_2$ which implies

$$c_2 > \frac{3}{2}b_2$$

Recalling that $2b_2^2 - c_2^2 = c_1^2 - 2b_1^2 = -1$,

which is equivalent to $c_2^2 - 2b_2^2 = 1$, we get by using $c_2 > \frac{3}{2}b_2$ that $\left(\frac{3}{2}b_2\right)^2 - 2b_2^2 < 1$.

This implies $\frac{b_2^2}{4} < 1$,

which implies b_2 is a positive integer with square less than 4, or that $b_2 = 1$.

This, however, yields $c_2^2 - 2(1)^2 = 1$ or $c_2^2 = 3$ in which case $c_2 = \sqrt{3}$, a +ve integer, false.

Thus the hypothesis that $b_3 \leq c_3$ as claimed.

We might note that $b_3 = c_3$ is equivalent to $c_2 = \frac{3}{2}b_2$ which implies $1 = c_2^2 - 2b_2^2 = \frac{b_2^2}{4}$.

This implies that $b_2 = 2$ and also $c_2 = \frac{3}{2} \times 2 = 3$.

This, in turn, gives $b_3 = c_3 = 1$ as well as $b_1 = 5, c_1 = 7$, so $m_1^2 = 5^2 \cdot 7^2 = a_3^2 \times (a_3 + a_2)^2 = T_3$.

In general, with $b_3 \leq c_3$, $m_3^2 = b_3^2 \times c_3^2 = \frac{2b_3^2 \times c_3^2}{2}$,

with $|2b_3^2 - c_3^2| = |2(c_2 - b_2)^2 - (2b_2 - c_2)^2| = |c_2^2 - 2b_2^2| = 1$.

So m_3^2 is again a square triangular number.

Since $c_2 > b_2 > 2b_2 - c_2 \geq c_2 - b_2 > 0$, or equivalently $c_2 > b_2 > c_3 \geq b_3 > 0$, m_3^2 is again smaller than m_2^2 .

If we let $m_3^2 = \frac{2b_3^2 \times c_3^2}{2} = \frac{(k_3 + 1)k_3}{2}$ with $k_3 = c_3^2$ (since $2b_3^2 - c_3^2 = 1$ gives $2b_3^2 = c_3^2 + 1$.)

We have $2b_3^2 = k_3 + 1$. Thus k_3 is now odd as in the first case and one can proceed in exactly the same manner generating new and smaller square-triangular number until we finally arrive at $m_n^2 = b_n^2 \times c_n^2 = 1$ with $b_n = c_n = 1$.

This gives us $1 = b_n = c_{n-1} - b_{n-1}$ and $1 = c_n = 2b_{n-1} - c_{n-1}$

which gives $b_{n-1} = 2$ and $c_{n-1} = 3$ when solved.

It follows that $2 = c_{n-2} - b_{n-2}$ and $3 = c_{n-1} = 2b_{n-2} - c_{n-2}$, which yields b_{n-2} and $c_{n-2} = 7, \dots$.

In general, for $j \geq 2$, $b_{j+1} = c_j - b_j$, $c_{j+1} = 2b_j - c_j$, and $b_j = c_{j-1} - b_{j-1}$, $c_j = 2b_{j-1} - c_{j-1}$.

Therefore, $2b_j + b_{j+1} = 2(c_{j-1} - b_{j-1}) + (c_j - b_j) = 2c_{j-1} - 2b_{j-1} + (2b_{j-1} - c_{j-1}) - (c_{j-1} - b_{j-1}) = b_{j-1}$

and $b_j + b_{j-1} = b_j + (2b_j + b_{j+1}) = 3b_j + b_{j+1} = 3c_{j-1} - 3b_{j-1} + (2b_{j-1} - c_{j+1}) - (c_{j-1} - b_{j-1}) = c_{j-1}$.

We have done the computation for the induction proof $b_j = a_{n-j+1}$ and $c_j = a_{n-j+1} + a_{n-j}$ for $j = 1, 2, \dots, n$. In particular, for $j = 1$, it follows that $m_1^2 = b_1^2 c_1^2 = a_n^2 (a_n + a_{n-1})^2$ and m_1^2 is our sequence as claimed.

Since all a_n are positive integers and so $T_n = a_n^2 \times (a_n + a_{n-1})^2$ is a strictly increasing sequence of squared-triangular number.

$$a_5 = 2 \times 12 + 5 = 29, a_6 = 2 \times 29 + 12 = 70$$

$$T_4 = 41616 < 250000$$

$$T_5 = 29^2 \times (29 + 12)^2 = \frac{1682 \times 1681}{2} = 1413721 > 250000$$

The largest N is 41616.

I12 若 $\triangle ABC$ 的邊長為 9、10 及 17，求 $\triangle ABC$ 外接圓的半徑。

If the lengths of the three sides of a $\triangle ABC$ are 9, 10 and 17,
find the radius of the circum-circle of $\triangle ABC$.

Reference: 1991 HI19

$$a = 9, b = 10, c = 17$$

$$\cos C = \frac{9^2 + 10^2 - 17^2}{2 \times 9 \times 10} = -\frac{3}{5}$$

$$\sin C = \sqrt{1 - \cos^2 C} = \frac{4}{5} \quad (\because 0 < C < 180^\circ \therefore \sin C > 0)$$

By sine formula, $\frac{c}{\sin C} = 2R$, where R is the radius of the circumscribed circle.

$$R = \frac{17}{2 \times \frac{4}{5}} = \frac{85}{8}$$

I13 求 $S = \frac{1}{2024} - \frac{3}{2024^2} + \frac{5}{2024^3} - \frac{7}{2024^4} + \frac{9}{2024^5} - \dots$ 的值。

Find the value of $S = \frac{1}{2024} - \frac{3}{2024^2} + \frac{5}{2024^3} - \frac{7}{2024^4} + \frac{9}{2024^5} - \dots$.

$$S = \frac{1}{2024} - \frac{3}{2024^2} + \frac{5}{2024^3} - \frac{7}{2024^4} + \frac{9}{2024^5} - \dots \quad \dots(1)$$

$$\frac{1}{2024}S = \frac{1}{2024^2} - \frac{3}{2024^3} + \frac{5}{2024^4} - \frac{7}{2024^5} + \frac{9}{2024^6} - \dots \quad \dots(2)$$

$$(1)+(2): \frac{2025}{2024}S = \frac{1}{2024} - \frac{2}{2024^2} + \frac{2}{2024^3} - \frac{2}{2024^4} + \frac{2}{2024^5} + \dots$$

$$2025S = 1 - \frac{2}{2024} + \frac{2}{2024^2} - \frac{2}{2024^3} + \frac{2}{2024^4} + \dots$$

$$S = \frac{1}{2025} \left[1 - \frac{2}{2024} \left(1 - \frac{1}{2024} + \frac{1}{2024^3} - \frac{1}{2024^4} + \dots \right) \right]$$

$$= \frac{1}{2025} \left[1 - \frac{2}{2024} \left(\frac{1}{1 + \frac{1}{2024}} \right) \right]$$

$$= \frac{1}{2025} \left[1 - \frac{2}{2024} \left(\frac{2024}{2025} \right) \right]$$

$$= \frac{1}{2025} \cdot \frac{2023}{2025} = \frac{2023}{4100625}$$

- 114** 在圖四中， XY 是一個以 O 為圓心及半徑為 5 cm 的圓的直徑。 XY 與弦 AB 相交於點 Q ，使得 $\angle AQO = 90^\circ$ 及 $XQ = QO$ 。 以 AB 為直徑的半圓與 XY 相交於 M ，延線 BM 與圓相交於點 C ，求 AC 的長。

In Figure 4, XY is a diameter of the circle with centre at O and radius 5 cm. XY intersects the chord AB at Q such that $\angle AQO = 90^\circ$ and $XQ = QO$. A semi-circle with diameter AB intersects XY at M . BM produced intersects the circle at C . Find the length of AC .

Join OA , OC and AC . Then $OA = OC = 5$ cm (radii)

$QA = QB = QM$ (radii of the semi-circle)

$\therefore \triangle QBM$ is a right-angled isosceles triangle.

$\angle QBM = \angle QMB = 45^\circ$ (base \angle s isos. \triangle , \angle sum of \triangle)

$\angle AOC = 2\angle ABC = 2\angle QBM = 90^\circ$ (\angle at centre twice \angle at \odot^{ce})

Apply Pythagoras' theorem on $\triangle OAC$: $AC = \sqrt{5^2 + 5^2}$ cm $= 5\sqrt{2}$ cm

圖四 Figure 4

- 115** 在圖五中，點 P 及 R 均在圓 C 上。 AP 是 C 的切線及 AR 相交於 Q 。若 $QR = 10$ 及 $PA = 5\sqrt{3}$ ，求 AQ 的長。

In Figure 5, P and R are points on the circle C . AP is the tangent to C at P and AR intersects at Q .

If $QR = 10$ and $PA = 5\sqrt{3}$, find the length of AQ .

Reference: 2000 FG1.4

By intersecting chords theorem, $AQ \times AR = AP^2$

Let $AQ = x$, then $x(x + 10) = (5\sqrt{3})^2$

$$x^2 + 10x - 75 = 0$$

$$(x - 5)(x + 15) = 0$$

$$AQ = x = 5$$

圖五 Figure 5

Group Events

- G1** 在圖一中， $VABC$ 是一個四面體，使得 $VA \perp VB$ 、 $VB \perp VC$ 及 $VA \perp VC$ 。 $VA=5$ ， $VB=4$ 及 $VC=3$ 。若 D 和 E 分別為 AB 和 AC 的中點，求角錐 $VBCED$ 的體積。

In Figure 1, $VABC$ is a tetrahedron such that $VA \perp VB$, $VB \perp VC$ and $VA \perp VC$. $VA=5$, $VB=4$ and $VC=3$. If D and E are the mid-points of AB and AC respectively, find the volume of pyramid $VBCED$.

圖一 Figure 1

Similar questions: HKCEE Mathematics 2006 Q17, Additional Mathematics 2001 Q15

$$\text{Volume of the tetrahedron } VABC = \frac{1}{3} \times \text{area of } \triangle VAB \times VC = \frac{1}{3} \times \frac{1}{2} \times 5 \times 4 \times 3 = 10$$

Let the area of $\triangle ABC$ be S . Let the height of the pyramid $VABC$ with base ABC be h . By calculating the volume of the pyramid $VABC$ in two different ways:

$$\frac{1}{3} \times S \times h = 10$$

$$h = \frac{30}{S}$$

$\therefore D$ and E are the mid-points of AB and AC

$\therefore DE \parallel BC$ and $DE = \frac{1}{2} BC$ (mid-points theorem)

$\triangle ADE \sim \triangle ABC$ (equiangular)

$$\frac{\text{Area of } \triangle ADE}{\text{Area of } \triangle ABC} = \left(\frac{DE}{BC}\right)^2 = \left(\frac{1}{2}\right)^2 = \frac{1}{4}$$

$$\frac{\text{Area of trapezium } BCED}{\text{Area of } \triangle ABC} = \frac{\text{Area of } \triangle ABC - \text{Area of } \triangle ADE}{\text{Area of } \triangle ABC} = 1 - \frac{1}{4} = \frac{3}{4}$$

$$\text{Area of trapezium } BCED = \frac{3}{4} S$$

$$\text{Volume of pyramid } VBCED = \frac{1}{3} \times \frac{3}{4} S \times h = \frac{1}{3} \times \frac{3}{4} S \times \frac{30}{S} = \frac{15}{2} = 7.5$$

- G2** 在圖二中， O 是圓 $DEFGHI$ 的圓心， $\triangle ABC$ 與該圓相交於 D 、 E 、 F 、 G 、 H 及 I ，使得 $AD = EB$ 及 $BF = CG$ ，已知 $\angle ABO = 38^\circ$ 及 $\angle ACO = 28^\circ$ ，求 $\angle BOC$ 。

In Figure 2, O is the centre of the circle $DEFGHI$. $\triangle ABC$ intersects the circle at D , E , F , G , H and I such that $AD = EB$ and $BF = CG$. If $\angle ABO = 38^\circ$ and $\angle ACO = 28^\circ$, find $\angle BOC$.

Reference: HKDSE 2014 Paper 2 Q21

Join OA . Let the feet of perpendiculars from O to AB , BC and CA be P , Q and R respectively. ($OP \perp BC$, $OQ \perp CA$, $OR \perp AB$)
 $AR = AD + DR = BE + ER = BR$ (line from centre \perp chord bisect chord)

$\therefore \triangle AOR \cong \triangle BOR$ (S.A.S.)

$BP = BF + FP = CG + GP = CP$ (line from centre \perp chord bisect chord)

$\therefore \triangle BOP \cong \triangle COP$ (S.A.S.)

$OA = OB = OC$ (corr. sides, $\cong \Delta$ s)

$\therefore \triangle COQ \cong \triangle AOQ$ (R.H.S.)

$\angle BOR = \angle AOR = 90^\circ - 38^\circ = 52^\circ$, $\angle COQ = \angle AOQ = 90^\circ - 28^\circ = 62^\circ$ (corr. \angle s, $\cong \Delta$ s)

$\angle BOC = 360^\circ - 2 \times 52^\circ - 2 \times 62^\circ = 132^\circ$ (\angle s at a pt.)

圖二 Figure 2

G3 設 a 、 b 及 c 為正整數。若 $ab + c = 2023$ 及 $a + bc = 2024$ ，求 $a + b + c$ 的值。

Let a , b and c be positive integers.

If $ab + c = 2023$ and $a + bc = 2024$, find the value of $a + b + c$.

$$ab^2 + bc = 2023b$$

$$ab^2 + 2024 - a = 2023b$$

$$a(b+1)(b-1) + 1 = 2023(b-1)$$

$$1 = (2023 - ab - a)(b-1)$$

$$(c-a)(b-1) = 1$$

$$(c-a=1 \text{ and } b-1=1) \text{ or } (c-a=-1 \text{ and } b-1=-1)$$

$$(c=a+1 \text{ and } b=2) \text{ or } (a=c+1 \text{ and } b=0) \text{ (rejected)}$$

Sub. $c = a + 1$ and $b = 2$ into $ab + c = 2023$

$$2a + a + 1 = 2023$$

$$a = 674, c = 675, b = 2$$

$$a + b + c = 674 + 2 + 675 = 1371$$

G4 在圖三中， A_1 、 B_1 及 C_1 分別為 BC 、 AC 及 AB 上的點，使得 $AC_1 = 2C_1B$ ， $BA_1 = 2A_1C$ 及 $CB_1 = 2B_1A$ 。

若 $\triangle ABC$ 的面積是 21 平方單位，求陰影部分的面積。

In Figure 3, A_1 , B_1 and C_1 are points on BC , AC and AB respectively such that $AC_1 = 2C_1B$, $BA_1 = 2A_1C$ and $CB_1 = 2B_1A$. If the area of $\triangle ABC$ is 21 square units, find the area of the shaded region.

圖三 Figure 3

Reference: 1986 FG10.2

Let P , Q and R be as shown in the figure.

By considering the areas of $\triangle ACA_1$ and $\triangle ABA_1$.

$$\frac{\frac{1}{2} AC \cdot AA_1 \sin \angle CAA_1}{\frac{1}{2} AB \cdot AA_1 \sin \angle BAA_1} = \frac{CA_1}{BA_1} = \frac{1}{2}$$

$$\Rightarrow \frac{AC \sin \angle CAA_1}{AB \sin \angle BAA_1} = \frac{1}{2} \dots\dots (1)$$

By considering the areas of $\triangle AC_1Q$ and $\triangle ABQ$

$$\frac{\frac{1}{2} AC_1 \cdot AQ \sin \angle CAA_1}{\frac{1}{2} AB \cdot AQ \sin \angle BAA_1} = \frac{C_1Q}{BQ}$$

$$\frac{AC_1 \sin \angle CAA_1}{AB \sin \angle BAA_1} = \frac{C_1Q}{BQ}$$

$$\frac{\frac{1}{3} AC \sin \angle CAA_1}{AB \sin \angle BAA_1} = \frac{C_1Q}{BQ}$$

$$\frac{1}{3} \times \frac{1}{2} = \frac{C_1Q}{BQ} \Rightarrow \frac{C_1Q}{BQ} = \frac{1}{6} \dots\dots (2)$$

By (1), $\frac{1}{3} \times \frac{1}{2} = \frac{C_1Q}{BQ} \Rightarrow \frac{C_1Q}{BQ} = \frac{1}{6} \dots\dots (2)$

By considering the areas of $\triangle CAB_1$ and $\triangle CBB_1$.

$$\frac{\frac{1}{2} AC \cdot CB_1 \sin \angle ACB_1}{\frac{1}{2} BC \cdot CB_1 \sin \angle BCB_1} = \frac{AB_1}{BB_1} = \frac{2}{1} \Rightarrow \frac{AC \sin \angle ACB_1}{BC \sin \angle BCB_1} = 2 \dots\dots (3)$$

By considering the areas of $\triangle CC_1P$ and $\triangle CBP$.

$$\frac{\frac{1}{2} CC_1 \cdot CP \sin \angle ACB_1}{\frac{1}{2} CB \cdot CP \sin \angle BCB_1} = \frac{C_1P}{BP}$$

$$\frac{CC_1 \sin \angle ACB_1}{CB \sin \angle BCB_1} = \frac{C_1P}{BP}$$

$$\frac{\frac{2}{3} AC \sin \angle ACB_1}{BC \sin \angle BCB_1} = \frac{C_1P}{BP}$$

$$\frac{2}{3} \times \frac{1}{6} = \frac{C_1P}{BP}$$

$$\text{By (3), } \frac{2}{3} \times 2 = \frac{C_1P}{BP}$$

$$\Rightarrow \frac{C_1P}{BP} = \frac{4}{3} \dots\dots\dots (4)$$

By (2) and (4), $C_1Q : QP : PB = 1 : 3 : 3$

By symmetry $B_1P : PR : RC = 1 : 3 : 3$ and $A_1R : RQ : QA = 1 : 3 : 3$

Let S stands for the area, $x = \text{area of } \triangle PQR$.

$$S_{\triangle ABC_1} = S_{\triangle BCB_1} = S_{\triangle ACA_1} = \frac{21}{3} = 7$$

$$\text{and } S_{\triangle AQC_1} = S_{\triangle BPC_1} = S_{\triangle CRA_1} = \frac{1}{7} \times \frac{1}{3} \times S_{\triangle ABC} = 1 \quad (\because C_1Q : BQ = 1 : 6 \Rightarrow C_1Q = \frac{1}{7} BC_1)$$

$$\text{The total area of } \triangle ABC: 21 = S_{\triangle ABC_1} + S_{\triangle BCB_1} + S_{\triangle ACA_1} + S_{\triangle PQR} - 3 S_{\triangle AQC_1}$$

$$21 = 7 + 7 + 7 + x - 3$$

$$x = \text{area of } \triangle PQR = 3$$

G5 求方程 $(\log_4 x^2)^2 + 9 \log_x 64 = \pi^{3 \log_\pi 3}$ 的所有根之和。

Find the sum of the roots of the equation $(\log_4 x^2)^2 + 9 \log_x 64 = \pi^{3 \log_\pi 3}$.

$$(\log_4 x^2)^2 + 9 \log_x 64 = \pi^{3 \log_\pi 3}$$

$$(2 \log_4 x)^2 + 9 \log_x 4^3 = (\pi^{\log_\pi 3})^3$$

$$4(\log_4 x)^2 + 27 \log_x 4 = 3^3$$

$$4(\log_4 x)^2 + \frac{27}{\log_4 x} = 27$$

$$4(\log_4 x)^3 - 27 \log_4 x + 27 = 0$$

$$(\log_4 x + 3)(2 \log_4 x - 3)^2 = 0$$

$$\log_4 x = -3, \quad \frac{3}{2} \quad \text{or} \quad \frac{3}{2}$$

$$x = 4^{-3}, \quad 4^{\frac{3}{2}} \quad \text{or} \quad 4^{\frac{3}{2}}$$

$$x = \frac{1}{64}, \quad 8 \quad \text{or} \quad 8$$

$$\text{sum of roots} = \frac{1}{64} + 8 + 8 = 16 \frac{1}{64} = \frac{1025}{64}.$$

- G6** 在圖四中，三個邊長為 1 cm 的正方形 $ABCD$ 、 $MNPQ$ 、 $MQRS$ 併在一起使得 A 及 B 分別為 MN 及 MS 的中點。已知一圓包這三個正方形，且通過 C 、 D 、 P 及 R ，求該圓的半徑。

In Figure 4, three squares $ABCD$, $MNPQ$ and $MQRS$ of sides 1 cm touch each other so that points A and B are the mid-points of MN and MS respectively. Given that a circle contains all three squares and passes through points C , D , P and R , find the radius of the circle.

By symmetry, the centre of the circle (O) lies on MQ .

Extend QM to meet CD at E . Then $DE = \frac{1}{2}$, $OE = 2 - x$

圖四 Figure 4

Let the radius be r . Apply Pythagoras' theorem on $\triangle ODE$ and $\triangle OPQ$.

$$x^2 + 1 = (2 - x)^2 + \left(\frac{1}{2}\right)^2 = r^2$$

$$1 = 4 - 4x + \frac{1}{4}$$

$$x = \frac{13}{16}$$

$$r^2 = \left(\frac{13}{16}\right)^2 + 1 = \frac{425}{256}$$

$$r = \frac{5\sqrt{17}}{16}$$

- G7** 若 x 、 y 及 z 為正整數，求能滿足 $xyz = 10000$ 的 (x, y, z) 組的數目。

If x , y and z positive integers, find the number of sets of (x, y, z) satisfying $xyz = 10000$.

$$10000 = 2^4 \times 5^4$$

$$x = 2^a \times 5^c, y = 2^b \times 5^d, z = 2^{4-a-b} \times 5^{4-c-d}$$

where a, b, c and d are integers such that $0 \leq a, b, c, d \leq 4$, $0 \leq a + b \leq 4$ and $0 \leq c + d \leq 4$

We count different combinations for a and b and different combinations for c and d separately.

Arrange the four '2's in a row:

| | | | |
|---|---|---|---|
| 2 | 2 | 2 | 2 |
|---|---|---|---|

There are 5 gaps between the four numbers, including the front and the end.

| | | | | | | | | |
|--|---|--|---|--|---|--|---|--|
| | 2 | | 2 | | 2 | | 2 | |
|--|---|--|---|--|---|--|---|--|

Insert two vertical sticks in these five gaps, so as to divide the four numbers into 3 groups.

The following is an example:

| | | | | | | | | |
|--|---|--|---|--|---|--|---|--|
| | 2 | | 2 | | 2 | | 2 | |
|--|---|--|---|--|---|--|---|--|

The first group has no number (left of the leftmost stick), the second group has one '2' (between two sticks), the third group has three '2' (right of the right most stick).

$$\text{Then } 2^a = 2^0 = 1, 2^b = 2^1 = 2, 2^{4-a-b} = 8$$

The following is another example:

| | | | | | | | | | |
|--|---|--|--|---|--|---|--|---|--|
| | 2 | | | 2 | | 2 | | 2 | |
|--|---|--|--|---|--|---|--|---|--|

The first group has one '2' (left of the leftmost stick), the second group has no number (between two sticks), the third group has three '2' (right of the right most stick).

$$\text{Then } 2^a = 2^1 = 2, 2^b = 2^0 = 1, 2^{4-a-b} = 8$$

It is equivalent to arrange 6 objects in a row, choose two object as sticks and the rest and '2'.

| | | | | | |
|---|---|---|---|---|---|
| X | X | X | X | X | X |
|---|---|---|---|---|---|

\therefore Number of combinations for '2's is $C_2^6 = 15$.

Similarly, the number of combinations for '5's is $C_2^6 = 15$.

The total number of combinations = $15 \times 15 = 225$.

G8 設 a 為實數。若方程 $x^2 + ax + 6a = 0$ 有兩個整數解，求 a 的最大和最小值之差。

Let a be a real number. If the equation $x^2 + ax + 6a = 0$ has two integral roots, find the difference between the largest and the smallest values of a .

Reference: 2001 FI2.2

\therefore The equation have two integral roots \therefore It can be factorised as $x^2 + ax + 6a \equiv (x - \alpha)(x - \beta)$

where α and β are integers. $a = -(\alpha + \beta)$ and $\alpha\beta = 6a \Rightarrow a$ is an integer

$\Delta = a^2 - 4(6a) = m^2$, where m is an integer.

$$a^2 - 24a + 12^2 = m^2 + 12^2$$

$$(a - 12)^2 - m^2 = 144$$

$$(a + m - 12)(a - m - 12) = 1 \times 144 = 2 \times 72 = 3 \times 48 = 4 \times 36 = 6 \times 24 = 8 \times 18 = 9 \times 16 = 12 \times 12$$

Let $a + m - 12 = p \cdots (1)$ and $a - m - 12 = q \cdots (2)$, where p and q are integers so that $pq = 144$

$$\frac{(1)+(2)}{2}: a - 12 = \frac{p+q}{2}$$

$$a = 12 + \frac{p+q}{2}$$

a is the largest when p, q are positive integers and the difference between p and q is the greatest i.e. $(p = 1, q = 144)$ or $(p = 144, q = 1)$

But this will gives $a = 12 + \frac{145}{2}$ which is not an integer \therefore rejected

The second choice is $(p = 2, q = 72)$ or vice versa, then $a = 12 + \frac{2+72}{2} = 49$

\therefore The largest possible $a = 49$

a is the smallest when p, q are negative integers and the difference between them is the greatest i.e. $(p = -1, q = -144)$ or $(p = -144, q = -1)$

But this will gives $a = 12 - \frac{145}{2}$ which is not an integer \therefore rejected

Another choice is $(p = -2, q = -72)$ or vice versa, then $a = 12 - \frac{2+72}{2} = -25$

\therefore The smallest possible $a = -25$

The difference between the largest and the smallest a is $49 - (-25) = 74$

G9 若三角形的邊長為 25、39 及 56，求該三角形的內心及垂心之間的距離。

If the lengths of the three sides of a triangle are 25, 39 and 56, find the distance between the incentre and the orthocentre of the triangle.

Reference: 2022 P1Q15

Let the sides of $\triangle ABC$ be $AB = 25$, $BC = 39$, $AC = 56$.

$$\cos A = \frac{25^2 + 56^2 - 39^2}{2 \times 25 \times 56} = \frac{4}{5}$$

$$\cos B = \frac{25^2 + 39^2 - 56^2}{2 \times 25 \times 39} = -\frac{33}{65} < 0 \Rightarrow B > 90^\circ$$

$$\cos C = \frac{56^2 + 39^2 - 25^2}{2 \times 56 \times 39} = \frac{12}{13}$$

The orthocentre H lies outside $\triangle ABC$.

Construct a circum-circle, centre at O with circumradius R .

$$\text{By sine rule, } \frac{a}{\sin A} = 2R \Rightarrow R = \frac{39}{2 \times \frac{3}{5}} = 32.5$$

Let the incentre be I .

Join AI and HI (note that H, B, I are not collinear)

$\angle BOC = 2\angle A$ (\angle at centre twice \angle at \odot^{ce})

Let P and Q be the mid-points of BC and AC respectively.

Then $\triangle BOP \cong \triangle COP$ (R.H.S.), $PQ \parallel AB$ and $PQ = \frac{1}{2}AB$ (mid-point theorem) (1)

$\angle COP = \angle BOP$ (corr. \angle s, $\cong \Delta$ s), $OP \perp BC$, $OQ \perp AC$ (line centre centre to mid-pt of chords \perp chords)
 $= \frac{1}{2} \angle BOC = \angle A$

$$OP = R \cos \angle COP = R \cos \angle A = 32.5 \times \frac{4}{5} = 26 \text{ (2)}$$

CB produced cut AH at D .

$\therefore H$ is the orthcentre. $ADH \perp CBD$, $BH \perp AC$

$OP \parallel AH$ and $BH \parallel OQ$ (int. \angle s supp.)

$\therefore \triangle OPQ \sim \triangle HAB$ (A.A.A., 3 pairs of \parallel -lines)

$$\frac{OP}{AH} = \frac{PQ}{AB} = \frac{1}{2} \text{ (corr. sides, } \sim \Delta \text{s and by (1))}$$

$$AH = 2OP = 2 \times 26 = 52 \text{ (by (2)) (3)}$$

In $\triangle AIB$, $\angle BAI = \frac{A}{2}$, $\angle ABI = \frac{B}{2}$ ($\because I$ is the incentre)

$$\angle AIB = 180^\circ - \frac{A}{2} - \frac{B}{2} \text{ (\angle sum of } \Delta \text{)}$$

$$= 180^\circ - \frac{180^\circ - C}{2} = 90^\circ + \frac{C}{2}$$

$$\text{Apply sine rule on } \triangle AIB, \frac{25}{\sin \angle AIB} = \frac{AI}{\sin \angle ABI}$$

$$AI = \frac{25 \sin \frac{B}{2}}{\sin(90^\circ + \frac{C}{2})} = \frac{25 \sin \frac{B}{2}}{\cos \frac{C}{2}} = \frac{25 \sqrt{\frac{1 - \cos B}{2}}}{\sqrt{\frac{1 + \cos C}{2}}} = \frac{25 \sqrt{1 - (-\frac{33}{65})}}{\sqrt{1 + \frac{12}{13}}} = 25 \sqrt{\frac{98}{65} \times \frac{13}{25}} = 7\sqrt{10} \dots (4)$$

In $\triangle ABD$, $\angle BAD = 180^\circ - 90^\circ - \angle ABD$ (\angle sum of \triangle)
 $= 90^\circ - (A + C)$ (ext. \angle of \triangle)

$$\angle HAI = \angle BAD + \angle BAI = 90^\circ - (A + C) + \frac{A}{2} = \frac{A + B + C}{2} - \frac{A}{2} - C = \frac{B - C}{2}$$

$$\begin{aligned} \cos \angle HAI &= \cos \frac{B - C}{2} = \cos \frac{B}{2} \cos \frac{C}{2} + \sin \frac{B}{2} \sin \frac{C}{2} = \sqrt{\frac{1 + (-\frac{33}{65})}{2}} \cdot \sqrt{\frac{1 + \frac{12}{13}}{2}} + \sqrt{\frac{1 - (-\frac{33}{65})}{2}} \cdot \sqrt{\frac{1 - \frac{12}{13}}{2}} \\ &= \frac{1}{2} \left(\sqrt{\frac{32}{65}} \cdot \sqrt{\frac{25}{13}} + \sqrt{\frac{98}{65}} \cdot \sqrt{\frac{1}{13}} \right) = \frac{1}{2} \left(\frac{4\sqrt{10}}{13} + \frac{7\sqrt{10}}{65} \right) = \frac{27\sqrt{10}}{130} \dots\dots (5) \end{aligned}$$

Apply cosine rule on $\triangle AHI$: $HI^2 = 52^2 + (7\sqrt{10})^2 - 2(52)(7\sqrt{10}) \times \frac{27\sqrt{10}}{130}$ by (3), (4) and (5)

$$HI^2 = 1682$$

$$HI = 41$$

G10 在圖五中， $ABCDE$ 為一正五邊形， BD 及 CE 相交於 P 。

若 $\triangle ABE$ 的面積為 1，求 $\triangle BPC$ 的面積。

In Figure 5, $ABCDE$ is a regular pentagon,
 BD and CE intersect at P .

If the area of $\triangle ABE$ is 1, find the area of $\triangle BPC$.

Let $AB = BC = CD = DE = EA = x$.

$$\angle BAE = \angle BCD = \frac{180^\circ \times (5 - 2)}{5} = 108^\circ \text{ (}\angle \text{ sum of polygon)}$$

$$\angle CBD = \angle CDB = \frac{180^\circ - 108^\circ}{2} = 36^\circ \text{ (base } \angle \text{s isos. } \triangle)$$

$$\text{Denote the areas by } S. S_{\triangle ABE} = \frac{1}{2} x^2 \sin 108^\circ = 1$$

$$\frac{1}{2} x^2 = \frac{1}{\sin 108^\circ}$$

$$S_{\triangle BPC} = \frac{1}{2} x^2 \sin 36^\circ$$

$$= \frac{\sin 36^\circ}{\sin 108^\circ}$$

$$= \frac{\sin 36^\circ}{\sin 72^\circ}$$

$$= \frac{\sin 36^\circ}{2 \sin 36^\circ \cos 36^\circ}$$

$$= \frac{1}{2 \cos 36^\circ}$$

$$\text{Let } y = 36^\circ, 5y = 180^\circ$$

$$3y = 180^\circ - 2y$$

$$\sin 3y = \sin(180^\circ - 2y)$$

圖五 Figure 5

$$3 \sin y - 4 \sin^3 y = \sin 2y = 2 \sin y \cos y$$

$\therefore \sin y = \sin 36^\circ \neq 0$, divide both sides by $\sin y$, we have

$$3 - 4 \sin^2 y = 2 \cos y$$

$$3 - 4(1 - \cos^2 y) = 2 \cos y$$

$$4 \cos^2 y - 2 \cos y - 1 = 0$$

$$\cos y = \frac{1 + \sqrt{5}}{4} \quad \text{or} \quad \frac{1 - \sqrt{5}}{4} \quad (< 0, \text{ rejected})$$

$$\begin{aligned} S_{\triangle BPC} &= \frac{1}{2 \times \frac{1 + \sqrt{5}}{4}} \\ &= \frac{2}{1 + \sqrt{5}} \cdot \frac{\sqrt{5} - 1}{\sqrt{5} - 1} \\ &= \frac{\sqrt{5} - 1}{2} \end{aligned}$$

Method 2

It is easy to show that $\triangle ABE \cong \triangle ACBD$ and their angles are $108^\circ, 36^\circ, 36^\circ$.

It is easy to show that $\triangle BCP$ is a $36^\circ, 72^\circ, 72^\circ$ triangle.

Also, it is easy to show that $\triangle PCD$ is a $108^\circ, 36^\circ, 36^\circ$ triangle.

Let $AB = BC = CD = DE = EA = x$. Then $BP = x$ (base \angle s isos. \triangle), let $DP = y$.

Then $BE = BD = BP + PD = x + y$ (corr. sides, $\cong \triangle$ s)

$\triangle PCD \sim \triangle ABE$ (A.A.A.)

$$\frac{BE}{CD} = \frac{AE}{PD} \Rightarrow \frac{x + y}{x} = \frac{x}{y} \quad (\text{corr. sides, } \sim \triangle \text{s})$$

$$1 + \frac{y}{x} = \frac{x}{y}, \text{ let } t = \frac{y}{x}, \text{ then } 1 + t = \frac{1}{t}$$

$$t^2 + t - 1 = 0$$

$$t = \frac{y}{x} = \frac{-1 + \sqrt{5}}{2} \quad \text{or} \quad \frac{-1 - \sqrt{5}}{2} \quad (< 0, \text{ rejected})$$

Denote the areas by S .

$$\frac{S_{\triangle PCD}}{S_{\triangle ABE}} = \left(\frac{PD}{AE} \right)^2 = \left(\frac{y}{x} \right)^2 = t^2 = 1 - t = 1 - \frac{-1 + \sqrt{5}}{2} = \frac{3 - \sqrt{5}}{2}$$

$$S_{\triangle PCD} = \frac{3 - \sqrt{5}}{2} \quad (\because S_{\triangle ABE} = 1)$$

$$S_{\triangle PCD} + S_{\triangle BPC} = S_{\triangle CBD} = S_{\triangle ABE} = 1$$

$$\frac{3 - \sqrt{5}}{2} + S_{\triangle BPC} = 1$$

$$S_{\triangle BPC} = \frac{-1 + \sqrt{5}}{2}$$
